

G proteins

María Martínez, Sergi Mira,
Ana Pérez, Aina Rill and
Carolina Villaró

Contents

1. Introduction

- a. G proteins: function and classification
- b. Tyrosine Kinase receptors

2. Ras-activating TK receptors

- a. EGFR
- b. PDGFR
- c. IR

3. The Ras G protein

- a. Grb2
- b. SOS
- c. Ras
- d. GAP

4. Ras mutations

INTRODUCTION

G proteins | GPCRs | TKRs

G proteins

- **Guanine nucleotide-binding proteins:** they can bind GTP and hydrolyze it to GDP.
- They act as a molecular switch: **active** when bound to **GTP**, **inactive** when bound to **GDP**.

G proteins - Classification

Monomeric G proteins

Ras superfamily of GTPases

Small proteins (20-25 kDa)

Homologous to the α -subunit

Cytosolic

Heterotrimeric G proteins

Divided into 4 families: G_s , $G_{i/o}$, G_q , $G_{12/13}$

Large complexes (~85 kDa)

3 subunits: α , β , γ

Membrane-bound (GPCRs)

G Protein-Coupled Receptors (GPCRs)

- Center of **signaling pathways** that control many essential processes, ranging from vision to carcinogenesis.
- Target of 20-50% of current drugs

GRAFS classification of GPCRs in vertebrates	
Glutamate family	12 GPCRs, including metabotropic glutamate receptors, GABA _B , and Ca ²⁺ sensing receptors.
Rhodopsin family	719 GPCRs (~80%), including receptors for most hormones and neurotransmitters.
Adhesion family	33 GPCRs
Frizzled family	11 GPCRs, including receptors for the frizzled protein family and smoothened.
Secretin family	15 GPCRs.

G Protein-Coupled Receptors (GPCRs)

N-terminus
(ectodomain)

7TM domain

C-terminus
(endodomain)

Heterotrimeric G proteins

Upon activation of the **GPCR**, the α subunit exchanges GDP for GTP, **dissociates** from the β/γ complex and goes on to regulate its **target**. The **β/γ complex** can also act as a signaling molecule.

FAMILY	SIGNAL TRANSDUCTION
G_s	Activates adenylate cyclase
G_i	Inhibits adenylate cyclase
$G_{q/11}$	Activates phospholipase C
$G_{12/13}$	Activates Rho family of GTPases
β/γ	Many proteins: PLA, Ca^{2+} channels, Ref

Heterotrimeric G proteins

-  α -subunit
-  β -subunit
-  γ -subunit

Monomeric G proteins - Ras

Schubert S, Shannon K, Bollag GHyperactive Ras in developmental disorders and cancer. Nat Rev Cancer 7:295-308.

Monomeric G proteins - Ras

Tyrosine Kinase Receptors

- Tyrosine kinases catalyse the transfer of a phosphate of group ATP to a hydroxyl group of serine or threonine

- Characterized by - Single transmembrane domain
- Glycosylated N-terminal extracellular domain with a high number of disulfide bonds.

Class	Family name	Members	Molecular characteristics of the extracellular domains
I	EGFR	EGFR, ERBB2, ERBB3, ERBB4	2 cysteine-rich domains
II	Insulin R	INSR IGFR	2 chains α and β , with one cysteine-rich and 2 FNIII domains
III	PDGFR	PDGFR α , PDGFR β , M-CSFR, KIT, FLT3L	5 Ig-like domains
IV	VEGFR	VEGFR1, VEGFR2, VEGFR3	7 Ig-like domains
V	FGFR	FGFR1, FGFR2, FGFR3, FGFR4	3 Ig-like domains, 1 acidic box
VI	CCK	CCK4	7 Ig-like domains
VII	NGFR	TRKA, TRKB, TRKC	2 Ig-like domains, rich leucin domains
VIII	HGFR	MET, RON	1 transmembrane α chain linked with one extracellular β chain
IX	EPHR	EPHA1 to 6, EPHB1 to 6	1 Ig-like, 1 cysteine-rich and 2 FNIII-like domains
X	AXL	AXL, MER, TYRO3	2 Ig-line, 2 FNIII-like domains
XI	TIE	TIE, TEK	2 Ig-like, 1 EGF, and 3 FNIII-like domains
XII	RYK	RYK	1 transmembrane β chain linked with one extracellular α chain
XIII	DDR	DDR1, DDR2	1 discoidin-like domain
XIV	RET	RET	1 cadherin-like domain
XV	ROS	ROS	6 FNIII-like domains
XVI	LTK	LTK, ALK	1 cysteine-rich domain
XVII	ROR	ROR1, ROR2	1 Ig-domain, 1 cysteine-rich domain and one kringle-like domains
XVIII	MUSK	MUSK	4 Ig-like and 1 cysteine-rich domains
XIX	LMR	AATYK1, AATYK2, AATYK3	A short extracellular domain
XX	Undetermined	RTK106	A short receptor chain with a short extracellular domain

TKR - Extracellular domain

- Its dimerization is essential for ligand recognition
- Its composition defines ligand specificity

TKR - Cytoplasmic domain

- With tyrosine kinase activity
- Formed by:
 - Amino-terminal lobe :
5-stranded β -sheet + 1 α -helix
 - Carboxy-terminal lobe: α -helical
- Variable lengths amongst families $\rightarrow$ specificity of intracellular signals

TKR - Cytoplasmic domain

TKR - Cytoplasmic domain

TKR - Cytoplasmic domain

IRK

IRK3P

TK RECEPTORS

EGFR | PDGFR | IR

EGFR

- Family: ErbB receptors
- Subfamily:
 - EGFR
 - Her2/neu
 - Her3
 - Her4
- Important in epithelial and cardiac development and nervous system.

THE RAS G PROTEIN

Grb2 | SOS | Ras | GAP

GRB2

GRB2

SH3 domains

SH2 domain

Son of Sevenless (SOS)

Sos protein consists of several domains:

- Histone-like domain (HD)
- Db1 homology domain (DH)
- Pleckstrin domain (PH)
- Helical linker domain (HL)
- Ras exchanger motif (REM)
- Catalytic GEF domain (CDC25)
- Proline-rich region

SOS - CDC25 domain

Helix αH of SOS:

- Hydrophobic side chain
- Acidic side chain

PEM questions

1. G protein-coupled receptors:
 - a. Contain 7 transmembrane helices.
 - b. Are involved in very few signaling pathways.
 - c. Are not targeted by any drug.
 - d. Inactivate the G protein when a ligand binds to them.
 - e. Are only found in fish.
2. Choose the **correct** answers related to tyrosine kinases:
 - a. Protein kinases catalyse the transfer of a phosphate group from ATP to a hydroxyl group of a serine or a threonine
 - b. The insulin receptor is a tyrosine kinase receptor
 - c. A and B are correct
 - d. Asp±Phe±Gly motif interfere the ATP binding
 - e. All of the answers are correct
3. Which of the domains of EGFR is in charge of the dimerization of the receptor?
 - a. Domain I
 - b. Domain III
 - c. A and B are correct
 - d. Domain II
 - e. Domain IV

PEM questions

4. Choose the **wrong** answer related to the class III Receptor Tyrosine Kinases (RTKs):
- a. PDGFR alpha and beta belong to RTKs.
 - b. They have a kinase insert between two kinases domains.
 - c. They are characterized by a 5-Ig-domain extracellular segment.
 - d. The kinase domain is located inside the cell.
 - e. Insulin Receptor belongs to class III RTKs.
5. Related to insulin binding to its receptor, choose the right statement:
- a. The receptor dimerizes after insulin binds to it.
 - b. The alpha and beta subunits of the receptor are bound through multiple disulfide bonds.
 - c. The insulin receptor has two binding sites for insulin.
 - d. The fibronectin type III domains (FnIII) of the insulin receptor contain alpha-helices.
 - e. The alpha-CT domain is not important for insulin binding.
6. PDGF receptors:
- a. They belong to the class IV Receptor Tyrosine Kinases (RTKs).
 - b. PDGFR α signaling is not important in the development of many organs.
 - c. The Juxtamembrane domain is widely studied.
 - d. The residues involved in the dimerization process are well conserved between different species.
 - e. PDGFRs need the dimerization of the receptor but they don't need any transphosphorylation.

PEM questions

7. Choose the correct answer related to SOS-Ras interaction:
- a. Pleckstrin domain is the one which binds G domain of Ras
 - b. All the interactions are between hydrophobic residues
 - c. There is no change in Switch I chain
 - d. Alpha-H is the one that interacts with the G domain of Ras
 - e. Leucine decreases the hydrophobicity of magnesium binding site
8. Ras proteins:
- a. They are composed by three domains
 - b. Switch I is the most conserved motif
 - c. They are small GTPase proteins
 - d. Ras-GTP form is the inactivated one
 - e. Threonine 35 binds the guanine base
9. Choose the **wrong** answer related to Ras inactivation:
- a. Ras proteins require GAP effectors to get inactivated.
 - b. The inactivation consists of the hydrolysis of the gamma phosphate of GTP.
 - c. Ras proteins do not have hydrolysis activity.
 - d. The main catalytic residue is Gln61.
 - e. A partial negative charge develops during the process.
10. Choose the correct statement of Ras mutations:
- a. They cause the same effects in GAP affinity than in GAP sensitivity.
 - b. Almost every mutation on residue 12 is oncogenic.
 - c. They can make up to a 50% decrease in the GAP-stimulated hydrolysis rate compared to wt Ras.
 - d. They cause drastic changes on Ras structure.
 - e. They only affect to Ras-RasGAP complex.

G proteins and GPCRs
